

# Alloys

An Alloy is a metal that has a mixture of two or more metals or sometimes a non-metal. The first known alloy was bronze, made from a mixture of copper and tin. Today there are many alloys that are used for many different applications like the structures of aircraft, rockets, cars, trucks, bikes, house hold appliances, tools, toys, computer gear, electronic equipment and the list goes on.

- Why do you think alloys and the technology of making alloys is important?
