

# Pneumatics

Pneumatics uses the power of compressed air to operate or drive machines that have been made to run on compressed air. Have you ever been to a car tyre replacement garage, they use a lot of air driven tools, for example the wheel nut remover tool is usually air operated.

## YOUR TASK:

Search through newspapers and old magazines for pictures of machines that use pneumatics. Cut them out and give an example of how pneumatics are used in that particular machine. For example: Trucks use pneumatics for their braking system. A nail-gun uses pneumatics as well as other air driven power tools.

If you use poster size paper or at least A3 photocopy paper you will be able to glue the pictures on and write a short description underneath.
