

Ultrasonics

Ultrasonic sound waves are a movement of particles back and forth along the direction the sound travels. Ultrasound is used in many applications. It is used in sonar for locating and measuring objects underwater. It can also be used in medicine. For example examining the brain of an ill person or to examine an unborn child in the mother's womb, avoiding the use of X-ray which is far more harmful.

Give a short dictionary description for each word:

Ultrasonic cleaning _____

Ultrasound scan _____

Ultrasonics _____

Ultrasonic welding _____

Ultrasonic testing _____
